# CHAPTER 1

---

## ProjectTemplate

---

A Python project template with docs, testing, CI, code coverage, and versioning.

- `sphinx` for html/pdf documentation, hosted at <https://project-template.readthedocs.io/>
- Travis-CI for continuous integration, hosted at [https://travis-ci.org/drsmith48/project\\_template](https://travis-ci.org/drsmith48/project_template)
- `pytest` and `tox` for testing
- `coverage` for test coverage, hosted at [https://codeclimate.com/github/drsmith48/project\\_template](https://codeclimate.com/github/drsmith48/project_template)
- `flake8` for code style/quality check, hosted at [https://codeclimate.com/github/drsmith48/project\\_template](https://codeclimate.com/github/drsmith48/project_template)
- `bumpversion` for versioning
- Run `make` for an overview of `Makefile` recipes

This project is adapted from the `cookiecutter` package template engine and the `cookiecutter-pypackage` template. <https://github.com/audreyt/cookiecutter>

### Stable release

To install ProjectTemplate, run this command in your terminal:

```
$ pip install project_template
```

This is the preferred method to install ProjectTemplate, as it will always install the most recent stable release.

If you don't have [pip](#) installed, this [Python installation guide](#) can guide you through the process.

### From sources

The sources for ProjectTemplate can be downloaded from the [Github repo](#).

You can either clone the public repository:

```
$ git clone git://github.com/drsmith48/project_template
```

Or download the [tarball](#):

```
$ curl -OL https://github.com/drsmith48/project_template/tarball/master
```

Once you have a copy of the source, you can install it with:

```
$ python setup.py install
```

## CHAPTER 3

---

### Usage

---

To use ProjectTemplate in a project:

```
import project_template
```

Contributions are welcome, and they are greatly appreciated! Every little bit helps, and credit will always be given. You can contribute in many ways:

### Types of Contributions

#### Report Bugs

Report bugs at [https://github.com/drsmith48/project\\_template/issues](https://github.com/drsmith48/project_template/issues).

If you are reporting a bug, please include:

- Your operating system name and version.
- Any details about your local setup that might be helpful in troubleshooting.
- Detailed steps to reproduce the bug.

#### Fix Bugs

Look through the GitHub issues for bugs. Anything tagged with “bug” and “help wanted” is open to whoever wants to implement it.

#### Implement Features

Look through the GitHub issues for features. Anything tagged with “enhancement” and “help wanted” is open to whoever wants to implement it.

## Write Documentation

ProjectTemplate could always use more documentation, whether as part of the official ProjectTemplate docs, in docstrings, or even on the web in blog posts, articles, and such.

## Submit Feedback

The best way to send feedback is to file an issue at [https://github.com/drsmith48/project\\_template/issues](https://github.com/drsmith48/project_template/issues).

If you are proposing a feature:

- Explain in detail how it would work.
- Keep the scope as narrow as possible, to make it easier to implement.
- Remember that this is a volunteer-driven project, and that contributions are welcome :)

## Get Started!

Ready to contribute? Here's how to set up *project\_template* for local development.

1. Fork the *project\_template* repo on GitHub.
2. Clone your fork locally:

```
$ git clone git@github.com:your_name_here/project_template.git
```

3. Install your local copy into a virtualenv. Assuming you have virtualenvwrapper installed, this is how you set up your fork for local development:

```
$ mkvirtualenv project_template
$ cd project_template/
$ python setup.py develop
```

4. Create a branch for local development:

```
$ git checkout -b name-of-your-bugfix-or-feature
```

Now you can make your changes locally.

5. When you're done making changes, check that your changes pass flake8 and the tests, including testing other Python versions with tox:

```
$ flake8 project_template tests
$ python setup.py test or py.test
$ tox
```

To get flake8 and tox, just pip install them into your virtualenv.

6. Commit your changes and push your branch to GitHub:

```
$ git add .
$ git commit -m "Your detailed description of your changes."
$ git push origin name-of-your-bugfix-or-feature
```

7. Submit a pull request through the GitHub website.

## Pull Request Guidelines

Before you submit a pull request, check that it meets these guidelines:

1. The pull request should include tests.
2. If the pull request adds functionality, the docs should be updated. Put your new functionality into a function with a docstring, and add the feature to the list in README.rst.
3. The pull request should work for Python 2.6, 2.7, 3.3, 3.4 and 3.5, and for PyPy. Check [https://travis-ci.org/drsmith48/project\\_template/pull\\_requests](https://travis-ci.org/drsmith48/project_template/pull_requests) and make sure that the tests pass for all supported Python versions.

## Tips

To run a subset of tests:

```
$ py.test tests.test_project_template
```

## CHAPTER 5

---

### Credits

---

### Development Lead

- David R. Smith <[drsmith48@gmail.com](mailto:drsmith48@gmail.com)>

### Contributors

None yet. Why not be the first?

#### **0.1.0 (2017-03-27)**

- First release on PyPI.

## CHAPTER 7

---

### Indices and tables

---

- `genindex`
- `modindex`
- `search`
